

Fertilization

A **prescription** soil treatment based on the results of the [soil analysis](#) and specific [needs](#) of the target specimen(s).

Any time someone, who has not analyzed your soil, tells you that you need a certain fertilizer, you can be certain they are **wrong**. Why? Because they don't know the **unique** nutrient profile of your soil. As the medical saying goes, prescription without diagnosis (a soil analysis in this case) is malpractice.

Trees require sixteen (16) essential elements to grow and thrive. An element is considered essential, if the tree cannot complete its life cycle without it and if the element is directly involved in the tree's metabolism. [Deficiencies](#) are common in the highly altered soils of urban landscapes.

[ISA Certified Arborists](#)[®] practice **prescription fertilization**, which means they **only** apply nutrients found to be deficient. This is important because adding excess and/or an improper balance of nutrients encourages and/or exacerbates many disease states.
